

Maruti Customer Concierge

A Hinglish voice-to-booking proof of concept for automotive retail

Executive proposition

The Maruti Customer Concierge demonstrates a direct path from spoken buyer intent to a confirmed test-drive booking. A customer speaks naturally in Hinglish, hears grounded model and dealership options, chooses a slot and location, provides contact details, and receives a **TD-XXXXXXX** reference without touching a form.

Sarvam AI provides the voice layer: **Saaras v3** transcribes every customer turn and **Bulbul v3** speaks each response. FastAPI and a deterministic state machine control the workflow, while SQLite stores the catalogue, fleet capacity, customers and bookings.

1 · The operational problem

Automotive pre-sales teams must convert enquiry intent into a scheduled showroom or home test drive. The journey can break when Hinglish intent is re-keyed, qualification is repeated, availability sits in another system, or the interaction ends without a booking reference.

The end user may be comfortable speaking but less willing to complete a long form. A voice-first assistant reduces interface effort while preserving an auditable transaction.

2 · Why an AI voice workflow

A traditional IVR is reliable but rigid. A general chatbot is flexible but may invent stock or skip required fields. The PoC uses a hybrid: natural speech at the edge, one-missing-field-at-a-time orchestration in the middle, and transactional validation at the core.

3 · Why Sarvam

Need	Sarvam role	Business relevance
Hinglish speech	Saaras v3 STT	Captures Hindi mixed with English model, location and time terms.
Audible replies	Bulbul v3 TTS	Turns the workflow into a call-like experience rather than chat only.
Future exceptions	Chat Completions	Adds flexible assistance while bookings remain deterministic.
Regional scale	India-language stack	Creates a path to additional languages using the same transaction contract.

4 · Architecture summary

The LLM is an optional free-form layer, not the authority for inventory or booking. The deterministic control plane owns state transitions, slot checks and final commitment.

From voice intent to a measurable transaction

5 · Demonstrated journey

Customer intent → model → dealership → date/time → home or dealership → name/mobile/address → live slot revalidation → booking ID.

The assistant handles spoken model aliases, Hindi relative dates, times, mobile digits and pincodes. The final address turn triggers the booking automatically; the customer is reminded to keep the original driving licence and Aadhaar or PAN available without providing document numbers.

6 · Illustrative ROI model

Discovery assumption	Illustrative value
Inbound pre-sales interactions	10,000 / month
Eligible for automated flow	60%
Assisted interaction cost	INR 60
Voice-AI interaction cost	INR 12
Monthly direct saving	INR 2.88 lakh
Annualised direct saving	INR 34.56 lakh

Formula: $10,000 \times 60\% \times (\text{INR } 60 - \text{INR } 12) = \text{INR } 2.88 \text{ lakh/month}$. These are discovery assumptions, not Maruti or Sarvam actuals. Replace them with customer volumes, fully loaded costs and commercial pricing.

A one-percentage-point improvement at 10,000 enquiries creates 100 additional test-drive opportunities per month. Revenue impact should be calculated from the customer's test-drive-to-sale conversion and contribution margin.

Pilot success measures

Booking completion · cost per confirmed booking · median time to booking · STT correction/repetition rate · slot-conflict rate · human handoff · attendance · downstream retail conversion.

7 · Current limitations

Hinglish browser demo; seeded catalogue and dealer capacity; process-local sessions; SQLite persistence; simulated SMS; no live telephony, CRM/DMS, production consent, retention, authentication or analytics layer.

8 · Recommended 90-day rollout

DAYS 0–30 · INTEGRATE	DAYS 31–60 · HARDEN	DAYS 61–90 · PROVE
Live dealer/fleet source Sarovam quality evaluation Security and consent Sandbox SMS	Postgres + Redis Telephony + CRM/DMS Observability + handoff Regression suite	Two-dealer cohort Weekly failure review Funnel comparison Scale/no-scale gate

RECOMMENDATION

Approve a two-dealer pilot focused on confirmed voice bookings completed without human re-entry.
